# Software Engineering (Part 3)

Copyright © 2024 by Robert M. Dondero, Ph.D. Princeton University

# Objectives

 We will cover these software engineering topics:

Stages of SW dev

How to order the stages

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- Maintenance
- Process models

# Objectives

### Software Engineering lecture slide decks:

Part 1	Requirements analysis Design (general)
Part 2	Design (object-oriented) Implementation Debugging
Part 3	Testing Evaluation
Part 4	Maintenance Process models

You're reasonably sure that your code is bug-free. What's next?

### Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- Maintenance
- Process models

### **Testing**

- Debugging: How can I fix the system?
- Testing: How can I break the system?

# **Testing**

- Testing taxonomy
  - Internal testing
  - External testing
    - White box
    - Black box
  - General strategies

- Internal testing
  - Designing your code to test itself
  - Done by programmers

- Internal testing techniques
  - Check for function/method failures
  - Validate parameters
  - Check invariants
  - Leave testing code intact!!!

### C: assert macro

```
assert(count >= 0);
```

### Essentially same as:

Asserts are enabled by default; to disable asserts:

```
gcc -D NDEBUG somefile.c
```

Python: assert statement

```
assert count >= 0, 'count is < 0'
```

Essentially same as:

```
if count < 0:
    raise AssertionError('count is < 0')</pre>
```

Asserts are enabled by default; to disable asserts:

```
python -O somefile.py
```

Java: assert statement (since JDK 1.4)

```
assert count >= 0 : "count is < 0";</pre>
```

Essentially same as:

```
if (count < 0)
  throw new AssertionError("count is < 0");</pre>
```

Asserts are **disabled** by default; to **enable** asserts:

```
java -ea SomeFile.java
```

### JavaScript (browsers):

console.assert function

```
console.assert(count >= 0, 'count is < 0');</pre>
```

Essentially same as:

```
if (count < 0)
  console.log('count is < 0');</pre>
```

### Cannot be disabled???

JavaScript (Node.js): assert function

```
const assert = require('assert');
...
assert(count >= 0);
```

### Essentially same as:

```
if (count < 0)
    throw new Error(
    'The expression evaluated to a falsy value');</pre>
```

### Cannot be disabled!

 Assert controversy: enable or disable asserts in production code?

# Testing: External

- External testing
  - Designing code or data to test your code

- White box external testing
  - External testing with knowledge of structure of tested code
  - Done by programmers

- White box external testing techniques
  - Statement testing
    - Testing to make sure each statement is executed at least once
  - Path testing
    - Testing to make sure each logical path is followed at least once

- White box external testing techniques
  - Boundary (corner case) testing
    - Testing with input values at, just below, and just above limits of input domain
    - Testing with input values causing output values to be at, just below, and just above the limits of the output domain

Glossary of Computerized System and Software Development Terminology

### Testing: External: Black Box

### Black box external testing

- External testing without knowledge of structure of tested code
- Done by quality assurance (QA) engineers

### Testing: External: Black Box

- Black box external testing techniques
  - Use case testing
    - Testing driven by use cases developed during design
  - Stress testing
    - Testing with a large quantity of data
    - Testing with a large variety of (random?) data

### Testing: General Strategies

### General testing strategies

- Automate the testing
  - To test your programs: create scripts
  - To test your modules: create software clients
  - Compare implementations when possible

# Testing: General Strategies

- Tool support for automating testing
  - Python: PyUnit
    - Example...

- Automated testing of fraction.py
  - See <u>testautomationgood/</u>
    - euclid.py
    - fraction.py
    - testfraction.py
      - Instead of fractionclient.py
      - Uses PyUnit
    - buildandrun
    - buildandrun.bat

- General testing strategies (cont.)
  - Test incrementally
    - Use scaffolds and stubs
    - Do regression testing
  - Let debugging drive testing
    - Reactive mode
    - Proactive mode: do fault injection

## Testing: Summary

- Testing taxonomy
  - Internal testing
  - External testing
    - White box
    - Black box
  - General strategies

You've tested your code to make sure it meets your expectations. What's next?

## Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- Maintenance
- Process models

#### **Evaluation**

#### Testing

Does the system meet your (the programmer's) expectations?

#### Evaluation

- Does the system meet the users' expectations?
- Does the system fulfill the needs of its users?

#### **Evaluation**

- Kinds of evaluation
  - By users
    - Actually, by software engineers in collaboration with users
  - By evaluation experts

- Questionnaires
- Interviews
- Focus groups
- Direct observation

Recall requirements gathering techniques

- Conducting interviews
  - (1) Recruit a set of users
  - (2) If necessary, compose a short written intro to your system
  - (3) Compose a written task sequence
    - Maybe abstracted from use cases developed during design

- Conducting interviews (cont.)
  - (4) For each user:
    - (4.1) If necessary, give the user the short intro, ask the user to read it, and confirm that the user understands it
    - (4.2) Give the user the task sequence
    - (4.3) For each task:
      - (4.3.1) Ask the user to read the task and confirm that the users understands it
      - (4.3.2) Ask the user to use your system to perform the task
      - (4.3.3) Ask (force!!!) the user to talk aloud while performing the task

- Conducting interviews (cont.)
  - (5) Take copious notes
  - (6) Audio/video record?
  - (7) Repeat for each kind of user

Jakob Nielsen

- From Jakob Nielsen
- For evaluating the whole system generally
- Using these 10 heuristics...

- Heuristic Evaluation
  - (1) Visibility of system status
    - The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

- Heuristic Evaluation
  - (2) Match between system and the real world
    - The system should speak the user's language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.

- Heuristic Evaluation
  - (3) User control and freedom
    - Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

- (4) Consistency and standards
  - Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

- (5) Error prevention
  - Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

- (6) Recognition rather than recall
  - Minimize the user's memory load by making objects, actions, and options visible. The user should not have to remember information from one part of the dialogue to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

- (7) Flexibility and efficiency of use
  - Accelerators—unseen by the novice user—may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

- Heuristic Evaluation
  - (8) Aesthetic and minimalist design
    - Dialogues should not contain information
       which is irrelevant or rarely needed. Every extra
       unit of information in a dialogue competes with
       the relevant units of information and diminishes
       their relative visibility.

- Heuristic Evaluation
  - (9) Help users recognize, diagnose, and recover from errors
    - Error messages should be expressed in plain language (no codes), precisely indicate the problem, and constructively suggest a solution.

- (10) Help and documentation
  - Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

#### Cognitive Walkthrough

- From Cathleen Wharton, Jakob Nielsen
- For evaluating part of the system in detail

#### Repeatedly:

Will the correct action be sufficiently evident to the user?
Will the user know what to do to achieve the task?

Will the user notice that the correct action is available?

Can users see the button or menu item that they should use for the next action?

Will the user associate and interpret the response from the action correctly?

Will users know from the feedback that they have made the correct or incorrect choice of action? So the system is finished. Or is it?
